

Major technological revolution underway:

'the era of robotics, automated systems, virtual reality, artificial intelligence'

By Frank Owarish, Ph.D., Computer Science, Executive Director International Institute for Strategic Research and Training (think tank) www.strategicresearch.info/default.aspx

Former faculty for MISM at Keller Graduate School of Management, Devry University, taught Computer Applications at undergrad and grad levels at CUNY for two decades

Introduction

Robotics, automated systems, virtual reality and artificial intelligence are four sets of technologies which have grown in importance in recent years have interrelationships which impact each other in terms of practical applications resulting in major transformation in the way things are done. It would be recalled that technologies in the 1970s had major transformational evolution with the convergence of computer and telecommunication technologies, at the time the first one based on digital signals and the second on analog signals and both combined through a digitalization process (Signal Analysis). The corner stone of the current ongoing technological transformation is systems theory which in a nutshell posits that practically all endeavors can be construed as a set of inputs which get transformed through processes into outputs. The following are examples of technological outputs: self-driving cars, computer integrated manufacturing, automated flight systems including ILS (instrument landing systems) and soon planes without pilots, cars largely manufactured by robots, robot financial advising, algorithmic trading (in the financial markets), robotic surgery and so on. The processes rely on codes which are increasingly sophisticated. The paper will take a brief look at the basics of these technologies including their mechanics, past evolution and state of the art. Potential future evolution will be reviewed as well. Analysis will focus on their contributions and impacts on industry and commerce, the distribution of wealth at national and global levels, the worlds of transit, medicine, finance, academia, business, entertainment and defence. Drawbacks such as the deskilling of the work force

with its financial consequences and the creation of new elites will also be appraised. Relevant claims reported in the media will be also be examined.

Technological revolution

Technologies are constantly moving, evolving all the time but at time something big happens, for example the IOT, now RASVRAI* is happening big time, a real revolution because they are happening at the same time often impacting each other; the interrelationships are quite significant; recall Alvin Toffler's First Wave, Second wave, Third Wave; would have qualified the current one as a mega-wave

*R=robotics; AS=automated systems; VR=virtual reality; AI=artificial intelligence

Elements of the Mega Wave

Automated system {AS}

Robotic {R}

Virtual reality {VR}, added reality/ augmented reality {AR}, mixed realty {MR}

Artificial intelligence {AI}

Basic automated system

This is typically a computer-based system which takes a series of steps and convert them into an algorithm which can run itself with minimal human intervention

Basic robotic

Basically a machine which runs an automated system with minimal to no human intervention

Basic virtual reality

This is a replication of reality, real or created, which runs on a computer system

Basic artificial intelligence

This is a state where a computerized system is able to make decisions, for example a thermostat set at a specific temperature makes adjustment by increasing or decreasing heat generated by the system so that the constant temperaure is maintained; similarly for a car in a cruise-control mode

Complex automated systems

Have been going on for decades

What's different now is that current day automation can be said to be intelligent not just mechanical

Often working in tandem with robotics, VR and AI

Complex robotics

Have also been going on for years but today increasingly relating to AI; often called smart robotics albeit robots that make decision

Complex virtual reality

The smart phone revolution ushered in a whole new world of virtual reality

You can visit a vacation resort online and see what it is like before making a decision

Associated terms are added reality, augmented reality, mixed reality

Complex artificial intelligence

Again AI has been happening for years, as a matter of fact started with the Turing Machine and 'enigma'

Today AI is coming of age

Case study methodology at Harvard University

When the MBA first started decades ago the field of business administration was partly known and partly in the making; the Harvard philosophy is that in context the material is best studied through existing and generally accepted concepts and also through case studies bringing light to the multifaceted aspects of the field; this methodology is warranted for the new field emerging, shaping up

Case studies

Real life 'cases' albeit stories

At times, with an attempt to conceptualize

Collection makes up new body of knowledge, of course evolving in nature

AS: Commercial flights

Commercial aviation is already heavily automated. Modern aircraft are generally flown by a computer autopilot that tracks its position using motion sensors and dead reckoning, corrected as necessary by GPS. Software systems are also used to land commercial aircraft

R: Robotic surgery

Robotically-assisted heart surgery, also called **closed-chest heart surgery**, is a type of minimally invasive heart surgery performed by a cardiac surgeon. The surgeon uses a specially-designed computer console to control surgical instruments on thin robotic arms.

Artificial intelligence

How is AI shaping up: Five predictions 2018 by Daniel Newman, Forbes

<https://www.forbes.com/sites/danielnewman/2017/12/12/5-artificial-intelligence-predictions-for-2018/#6fb7930f1063>

1. Data driven machines

It's what most companies will be focusing on ... With the steady growth of data produced by the Internet of Things (IoT), businesses will be turning to machine learning to process, trend, and analyze the information. Machine learning AI is a *must-have*. It's the only way companies can make valuable sense of the flow of data—both structured and unstructured—coming in (simply be too much for any human to manage). (If you don't yet have an AI strategy in place, don't worry. Forrester predicts up to 80% of firms will rely on "insights-as-a-Service" in at least some capacity in 2018.)

2. More Human-like Help

More and more businesses are moving toward harnessing the power of conversational AI chatbots and other virtual assistants to manage the day-to-day flow of work. It is estimated that some 85% of customer interactions will be managed by AI by 2020. In the near-term, we'll likely see an increased focus on bot sensitivity training, which will allow humans to offload even more work on chatbot shoulders. And I'm not just talking about business. Amazon's Alexa recently began syncing with Outlook and Google to help families keep up with their hectic schedules. Meanwhile, a new virtual assistant from X.ai called "Amy" can be trusted to respond to messages regarding meetings, meals, and calls without ever alerting the sender she's a bot. We may not be ready for the *Jetsons'* Rosie, but we're getting closer.

3. Siri—And Other Tech—Will Hear You Better

Ugh, the pain of voice-texting a message, only to find you need to edit nearly every word because Siri didn't get it. My guess is we'll finally get a handle on conversational technology in 2018, including not just emotional sensitivity, but translational technology that allows us to communicate seamlessly between languages. This is big for both business and personal life, as I recently discussed in The Many Benefits of Conversational AI. Amazon is already training Alexa to recognize speech patterns that may be indicative of suicide. Eventually, bots may be able to perform psychiatric counseling or serve as a support network for those who are isolated.

4. Smart Automation Continues

Have you noticed Amazon's subscription order services? When you purchase day-to-day products, it actually auto-populates your order to schedule regular delivery of these items—whether it's paper towels, laundry, detergent, or dog food—on a weekly or monthly basis. Talk about locking you in to future sales. Just as AI has already shaken up the marketing industry with its ability to personalize marketing campaigns—and even tweak them in real-time—we'll continue to see AI bringing smart automation to an even wider range of industries—from retail product delivery to machine maintenance, energy conservation, and more.

5. AI Adoption Will Continue To Grow

OK, this may not warrant its own bullet, but I just wanted to emphasize the fact that AI isn't going anywhere. In fact, as the technology continues to refine itself, engineers are finding even greater—and more granular—uses for it, in all aspects of our lives. Yes, robots and self-flying delivery drones are cool. But the things we're seeing now—and into 2018—are perhaps just as amazing. They have the power to take much of the drudgery out of our daily work and personal lives—something pretty much all of us can rally behind as we close another active year of tech advancement.

Conclusion

Blending all the elements together creates a mega revolution transforming the way business operates

The impact will also be felt in government and non profit organizations
